

Step-by-step guide

Start with basic configurations and move to more complex ones

Other hints

- **Deploy with simpler types of devices first**, for example, Super-Beacons, and only then move to more complex ones. Thus, you can avoid pitfalls. For example, as compared with the Super-Beacon:
 - Mini-RX: more narrow ultrasound reception beam; embedded antenna
 - Industrial beacons: no internal battery; more complex connectors
 - Mini-TX: can only transmit and weaker, than Super-Beacon
 - Helmet, Jacket, Badge: more complex microphone settings
- The same for the Super-Modem. It is greater, than Modem v5.1, but Modem v5.1 is recommended to start with:
 - Basic USB connector instead of special cable
 - Super-Modem has two SW packs: main one and for the micro-SD card
 - No need to setup IP address or WiFi settings
- If the step doesn't work, **step back**, check the previous configuration, carefully deploy the new one again
- Of course, follow the **step-by-step guide** from the [Operating Manual](#) with SW update, Default settings, etc.
- **Avoid [typical mistakes](#)**
- **Watch [this presentation in video](#)**
